Longevity Outreach System

A GTM automation workflow built in n8n. It scores longevity practices, runs a 6-touch outreach sequence over 18 days, and reacts to how each prospect behaves.

What it does

- Sources 75 fictional NYC longevity practices from a fixed seed.
- Scores each practice 0 to 100: decision access 25, digital maturity 25, growth signals 20, product fit 20, size fit 10. Tier A is 80 and up.
- Runs a 6-touch, 18-day sequence: day 1 practice manager email, day 4 LinkedIn connection note to the founder, day 8 mailed one-pager, day 11 take-home example, day 15 video link plus LinkedIn message, day 18 closing email.
- Reacts to behavior: an open adds 4 points, a click adds 8 and pulls the day 11 example forward, a positive reply cancels automation and routes the account to a human, silence through day 11 subtracts 6 and moves the account to monthly nurture.

Demo data only

Every practice, person, and message here is fictional sample data. The workflow contains no send nodes: every message is written to a file, never sent. In production, sourcing would come from the NPI registry and the CMS provider directory.

How to use it

1. In n8n, go to Workflows and choose Import from file.
2. Select `Longevity_outreach_system.json`.
3. Run the "Run full pipeline" trigger to score clinics and build messages, or "Run reaction demo" to see the reaction logic.

Files

- `Longevity_outreach_system.json`: the n8n workflow export (13 nodes, no credentials needed).
